CLAIMS

WHAT IS CLAIMED IS:

- 1. A cylindrical ultrasound transducer comprising:
 - a cylindrical inner electrode;
- 5 a cylindrical piezoelectric material disposed over the inner electrode; and
 - a cylindrical outer electrode disposed over the cylindrical piezoelectric material, the cylindrical outer electrode having spiral grooves separating the outer electrode into a plurality of discrete helical elements.
- 10 2. The cylindrical ultrasound transducer of claim 1 wherein the inner electrode comprises a metallic layer.
 - 3. The cylindrical ultrasound transducer of claim 2 wherein the metallic layer comprises Nickel.

15

- 4. The cylindrical ultrasound transducer of claim 2 wherein the metallic layer comprises Gold.
- 5. The cylindrical ultrasound transducer of claim 1 wherein the cylindrical piezoelectric material comprises a high-density fin grain PZT ceramic material.
 - 6. The cylindrical ultrasound transducer of claim 1 wherein the cylindrical piezoelectric material is polished to a mirror finish of approximately 10 microns.

- 7. The cylindrical ultrasound transducer of claim 1 wherein the outer electrode comprises a metallic layer.
- 5 8. The cylindrical ultrasound transducer of claim 7 wherein the metallic layer comprises Nickel.
 - 9. The cylindrical ultrasound transducer of claim 7 wherein the metallic layer comprises Gold.

10

- 10. The cylindrical ultrasound transducer of claim 1 wherein the discrete helical elements are intertwined.
- 11. The cylindrical ultrasound transducer of claim 1 wherein the spiral grooves

 further separate the piezoelectric material into a plurality of substantially discrete zones.
 - 12. The cylindrical ultrasound transducer of claim 11 wherein the zones are helically shaped and intertwined.
- 20 13. The cylindrical ultrasound transducer of claim 1 further comprising a matching layer disposed over the outer electrode.

- 14. The cylindrical ultrasound transducer of claim 13 wherein the matching layer fills the grooves.
- 15. The cylindrical ultrasound transducer of claim 13 wherein the matching layer5 comprises a low viscosity polymer.
 - 16. The cylindrical ultrasound transducer of claim 13 wherein the polymer is an epoxy adhesive.
- 10 17. A cylindrical ultrasound transducer comprising:
 - a cylindrical inner electrode;
 - a cylindrical piezoelectric material disposed over the inner electrode;
 - a cylindrical outer electrode disposed over the cylindrical piezoelectric material; and
- spiral grooves cut through the outer electrode and at least a portion of the cylindrical piezoelectric material, the spiral grooves separating the transducer into a plurality of functionally discrete helical transducer segments.
- An ablation element comprising a plurality of intertwined helical transducers arranged linearly along a longitudinal axis.

19. An ablation element comprising an ultrasonic transducer segmented into a plurality of functionally discrete intertwined helical transducer segments arranged linearly along a longitudinal axis.

5 20. An ablation catheter assembly for ablating a region of tissue in a body space comprising:

an elongate delivery member having a proximal end portion and a distal end portion;

an anchor mechanism coupled to the distal end portion of the elongate delivery

member, the anchor mechanism being adapted to engage a substantial portion of tissue in

10 the body space;

and an ablation element secured to the distal end portion of the elongate delivery member, the ablation element having an ultrasonic transducer segmented into a plurality of functionally discrete intertwined helical transducer segments arranged linearly along a longitudinal axis.
